

# FEELING UNDER THE WEATHER?

.... spare a thought for our planet.

The Earth has a fever. At just one degree it's already dehydrated. But worse is to come. There's enough CO<sub>2</sub> in the air right now to heat it by 2-3 degrees: enough to turn Victoria into desert and drown our coastal cities and towns. That'll make today's problems look pretty minor.

**Diagnosis: Dangerous Warming by Carbon Dioxide (CO<sub>2</sub>) pollution.**

**Cure Needed: Urgently reduce CO<sub>2</sub> from 385 to under 350 (ppm):**

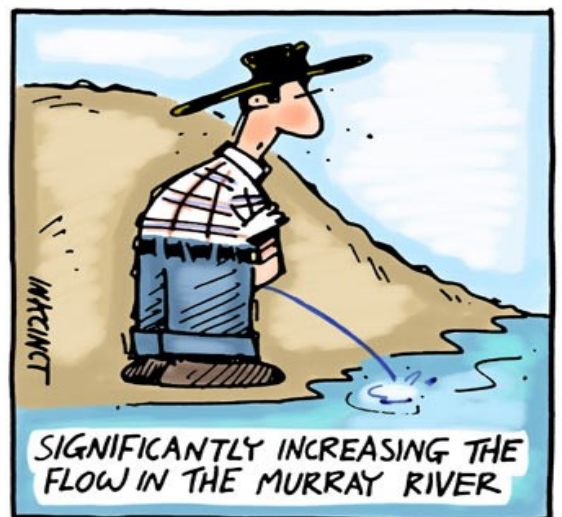

- End coal pollution in developed countries by 2020, using energy efficiency and renewables on a massive scale;
- End coal pollution globally by 2030;
- Rapid transition to pollution-free transport like electric and hydrogen;
- Agricultural, forestry and waste reform to store carbon, not emit it.

The current plan, to simply trade emissions with weak targets, will not achieve this. A carbon tax with 100% returned to the people, plus moratoriums on coal plants can.

But governments must start standing up to the big polluting corporations.

**Australia is a rich, vulnerable and heavy polluter and must lead the world with bold, life-saving actions, not excuses. Tell a politician.**

**OUR POLLUTION, OUR CLIMATE.**
